

# Bio-Bait...the livebait alternative

Kevin Dahlke

Are you a livebait fishermen or fisherkid, but don't like the mess of livebait? Well there is an alternative out there without the mess, and it is called Bio-Bait. Bio-Bait is not your average artificial alternative bait; there are NO plastic ingredients that can be left behind that will take years to dissolve.

Bio-Bait is a totally organic bait that if fish, bird or other mammals eat it, it will safely digest through their system. What Bio-Bait consists of is soy and real bait flesh.

The soy which is the base for this product is in the shape of a noodle and is of a hard consistency before being used. Also, being soy based, allows the product to have 75% protein in it and with this concentration this will give the fish something that they are looking for. For the other component of Bio-Bait is the actual flavoring that is put on this soy base and you can get any of your favorite livebait flavors: crawfish, larva, mealworm/shiners, crawlers and leeches.

When you open the package the baits will be of a hard consistency. To soften them all you need to do is add a small amount of water to the bag and let it sit for fifteen minutes. When you are done fishing with Bio-Bait, there is no need to throw it away as all you need to do is put the soft baits in the freezer at home or leave them to air dry to get hard again. Then the next time you go fishing, just add water and you are ready to go again.

The bait is used by itself on plain hooks, but also can be added to artificial lures as well. A benefit of adding it to lures is it adds scent to the bait as an attractant. Another bonus is that Bio-Bait is buoyant and by having it on weighted jigs or spoons, this will make these lures fall slower in the water column and fish are always attracted to slowly falling baits. Bio-Bait comes in a variety of colors that will also add a visual attractant to your lure.

Bio-Bait is a great product to use with kids when you are fishing. Kids, a majority of the time, are afraid of moving livebait and this is a more economical alternative and also lasts longer on the hook as well. Kids have a tendency to cast baits fairly hard and most livebait will fly off of the hook.

But, Bio-Bait has a very durable texture and composite that stays put on the hook much better and won't tear free very easily.

With the simplicity of Bio-Bait, it has no mess and there is no fuss for kids to use it themselves. For the kids that

are biking to their favorite pond, all they need to do is toss a bag in their backpack and they are set for a day of fishing. No more minnow buckets, no more boxes of worms drying out in the sun. With trips to Canada and also the Boundary Waters Areas, Bio-Bait packs away very nicely and compact and it is like having livebait with you, but without the headaches.

If you haven't tried Bio-Bait yet, today is the day to try the livebait alternative, Bio-Bait.
